

Aegis

The spend-control firewall for AI agents

Built on Arc Network · USDC-native · Agentic Economy track

THE PROBLEM

Agents can pay. **Trusting them with money is the hard part.**

AI agents are getting wallets and paying for APIs, data, and other agents — autonomously. But a raw private key has no limits:

One prompt injection

and a hijacked agent drains the whole wallet in 30 seconds.

One bad loop

and it spends the monthly budget on retries before anyone notices.

One leaked key

and there is no undo button on a blockchain.

Nobody wires a treasury to software with no spending controls.
Today, agent wallets are exactly that.

THE SOLUTION

The agent never holds the money. The policy does.

PROVEN LIVE ON ARC TESTNET

We sent our own agent rogue. **Aegis cut it off.**

27.8x

spike over the agent's
normal spending —
detected on the first rogue
transaction

~10 s

from anomaly to on-chain
circuit breaker — every
later spend reverted with
VaultPaused

< \$5

worst-case loss,
mathematically bounded by
on-chain limits — even if
the risk brain dies

Every claim is verifiable on-chain. Breaker transaction:

`testnet.arcscan.app/tx/0xa0c25f9342bb8ec4f10e1d84a611ce556b248c96c25a9c7a8fb66c1d7ef04d8f`

The agent economy's money, **native.**

USDC is the native asset

Gas, payments, budgets — one unit of account, no token juggling. Spend policies read exactly like a corporate card policy: in dollars.

⚡ **Sub-second finality**

Machine-speed payments need machine-speed settlement — and a circuit breaker that lands in seconds, not minutes.

Compliance-first stack

Enterprises will demand controls, auditability, and trust before wiring treasuries to agents. Circle's ecosystem is built on exactly that story — so is Aegis.

THE ANALOGY THAT ALREADY WORKED

Ramp & Brex, for the agent economy

Corporate cards existed for decades. Ramp and Brex turned **spend control** — limits, approvals, fraud detection — into multi-billion-dollar companies, because control is what unlocked giving cards to every employee.

Agent wallets are where corporate cards were in 1990: powerful, and terrifying to hand out.

Aegis is the control layer that lets companies say yes — to every agent, with a budget, an allowlist, and a kill switch.

WHERE THIS GOES

Working today. Growing from here.

✓ TODAY

Live MVP on Arc testnet

Policy vault deployed, risk brain, live dashboard with a red-team demo. 8/8 contract tests.

NEXT

Natural-language policy

"Max \$50/day, only these three vendors" → compiled to on-chain config. Policy as a sentence.

THEN

Fleets & factories

Multi-agent, multi-vault orgs; per-agent budgets; a vault factory so any team deploys in one click.

MAINNET

Audit & production

Security audit, opt-in privacy for sensitive amounts, mainnet launch alongside Arc.

If agents are getting money, **Aegis is the trust layer.**
